

No More Waste: Class Concepts

This MVP focused on community interaction. Community cultivation was implemented by focusing on internal coordination. There was no external coordinator assigning volunteers to restaurants like the other technology configurations had. Instead, each role (business, driver, shelter) had the change to coordinate themselves. The driver and shelter would need to coordinate with the restaurants pickup time, the driver would also need to choose what shelter they pick and update their status so both the restaurant and shelter are kept updated. The service context, public mission, is now also being served after this MVP. The public mission is essentially the prevention of food waste and the donations being able to feed the homeless. This is now being fully implemented on the application as there is a way for the food to be donated, a driver to volunteer and a shelter to be selected. Now the donation can fully be delivered to the shelter on the application with all the functionality working. Lastly, individual participation is also being fully met since each of the roles must individually decide to participate by interacting on the post of a certain donation.

This MVP also focused on knowledge management by including both an archive and a facts page. The archive now allows other businesses to become more aware of the direct impact being made by letting them see exactly who is donating and what is being donated. It also lets businesses track their own impact by checking their own donations page. The facts page allows Lurkers and other users to gain some more knowledge about food waste and ways they can prevent it in their own lives.
